1 Introduction

1.1 Project Summary

1.1.1 Objectives

- Teraverde seeks a product to provide a proprietary tool to permit buyers and sellers of loans to search a database of loans from a variety of sellers to:
  - Identify loans that fit a buyer's credit, geographic, loan size and other criteria;
  - Identify all loans and loan characteristics available for sale from a seller's perspective, as well as identifying loans (and their characteristics) that are available for sale, allocated to a particular buyer, or have been sold to a particular buyer.
- The **SprinkleX** platform will provide a proprietary method to perform these searches, save particular search criteria, and perform real-time drill-downs and 'what ifs' for business intelligence purposes using Qlik Sense.
- The **SprinkleX** platform will also use Qlik NPrinting to provide defined reports for each client to run ad hoc or on a schedule, and also to publish reports to a client 'newsstand' for access by client personnel on demand.
- As such, the database to be utilized by Qlik tools should:
  - Create a secure SQL database for the **SprinkleX** platform; the prior database was maintained within Excel worksheets.
  - The SQL database will serve as a central repository for various items including but not limited to: seller tapes, market pricing tables, loan-level price adjustment tables, calculations/algorithms, geocoding map, public financial data, etc.
  - The overall objective is to ensure that the business intelligence application, Qlik, can properly interact with the newly created SQL database.
  - The updates and maintenance of the SQL database is important as it "pushes out" the data inventory through the Qlik application; the Qlik application also has the ability to "write back" to the SQL database, therefore that data must be assessed and maintained in the SQL.

1.1.2 Background

SprinkleX will serve as a proprietary platform that allows for the increased visibility of loans available for purchase throughout the U.S. **SprinkleX** is targeted to those institutions that are looking to purchase loans to add to its existing portfolio. In future phases, **SprinkleX** will also be targeted to those institutions that are looking to sell loans, increase market reach, and attract new buyers.

1.1.2.1 Business Drivers

- **Financial Drivers** - The launch of **SprinkleX** is part of the strategic plan of Teraverde. A sound and secure SQL framework for **SprinkleX** will allow the Company to market this product to various financial institutions across the U.S. Revenues are generated by subscription to the **SprinkleX** platform.

- **Operational Drivers**– A beta version of **SprinkleX** was launched with an excel worksheet maintained as the active database. Any updates and changes made to Excel is difficult to track and also difficult to scale as the Company draws in more subscribers to the **SprinkleX** platform.
- **Market Drivers**– As noted within the background, there is a need for a proprietary platform that allows for the increased visibility of loans for purchase throughout the U.S.

Information security of the database contents is important, as sections of the database will contain Personally Identifiable Information (PII).

1.2 Project Scope

1.2.1 In Scope Functionality

- Create unified SQL database to maintain loan inventory records
  - Establish Standardized TV Loan Inventory
  - Market Price Calculation Configuration
  - Loan Level Pricing Adjustments (LLPA) Configuration
  - Geocoding Configuration
  - SNL Data Configuration
- Enable Qlik Sense "write-back" functionality to the SQL Database
- Ensure SQL database can accept updates for "write-back" functionality from Qlik Sense
- Ensure SQL database can maintain loan inventory transaction histories.
- Create Reporting to monitor SQL database activity
  - Data Load validation/exception reporting to capture missing or invalid data
  - Audit Trail reporting to capture an activity log and/or data load time stamps
- Secure the SQL database to limit authorized access or attacks

1.2.2 Out of Scope Functionality

Certain out of scope items may be included in future phases.

- Exclude the generation of request for commitment
- Interface with Loan Logics
- Interface with ResiTrader
- Interface with lender secondary marketing systems

2 Business Process Overview

2.1 Current Business Process (As-Is)

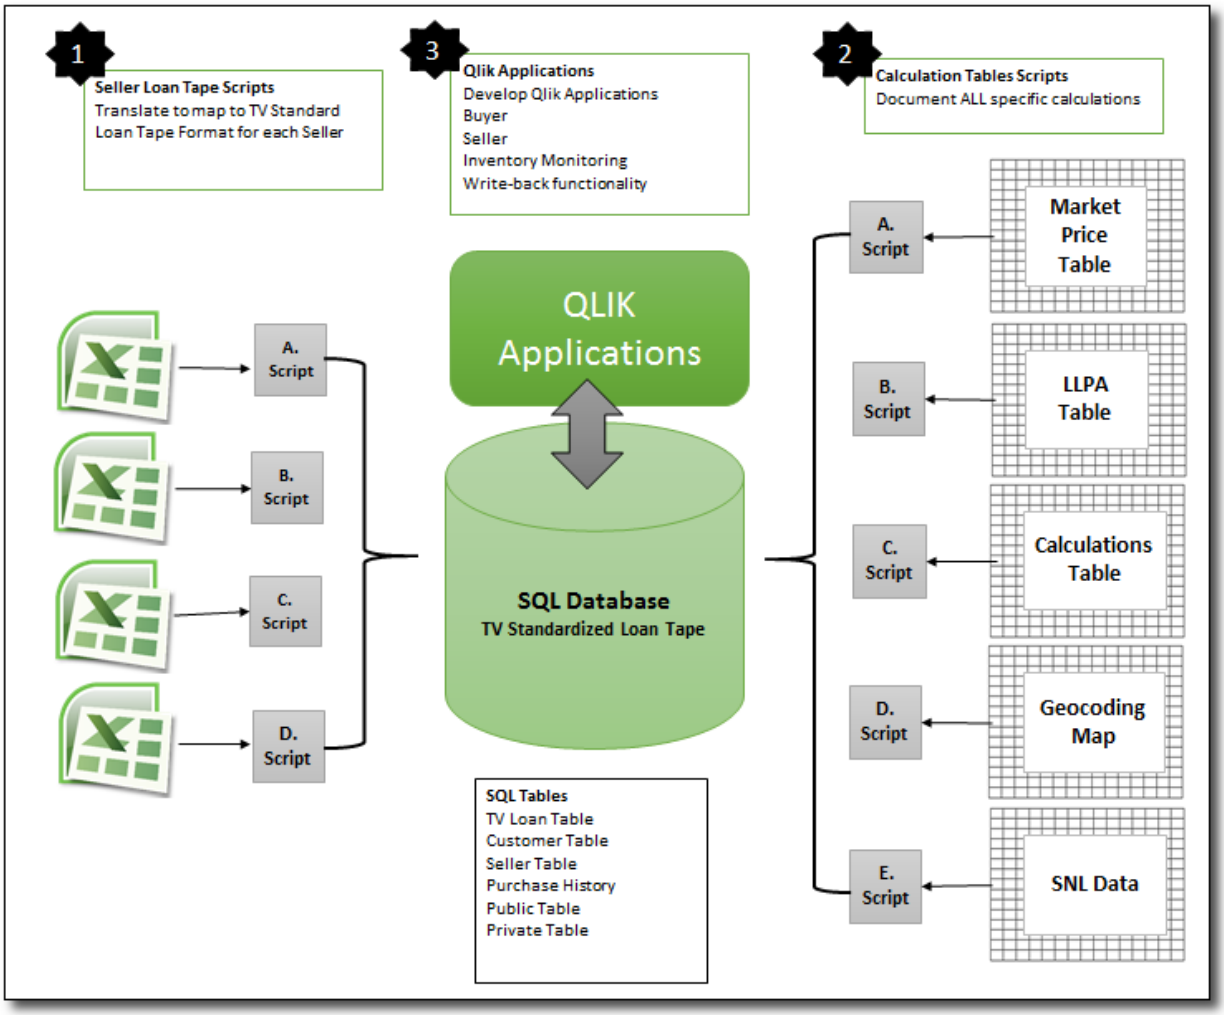
Refer to the "SprinkleX_SQL Dev Workbook"

The current process is as follows

- *Loan tapes from sellers are received in an Excel format. Each seller's loan tape is unique, but does contain common data elements such as original loan balance, FICO scores, geography information, etc.*
- *Teraverde must manually make uniform all the tapes received. Currently there are 4 sellers tapes that Teraverde has "mapped" into single usable flat file from which to run the business intelligence application, Qlik*
- *There are a series of "tables" that are applied against the loan data such as Pricing, Loan-Level pricing adjustments, calculations, etc. to arrive at additional "data elements" that are separate than the "raw data elements" contained with the Seller Tapes. These additional data elements will also need to be captured within SQL and assigned to each loan record on an individual basis.*
- *Generally, the items that require updates include: (a) the pricing table which needs to be updated daily and (b) the loan inventory records as sellers add and remove loans.*
    - *The pricing table is currently maintained in an excel worksheet tab. Teraverde staff logs into the MBS Live website and manually keys in the price into the Excel worksheet. Once it is keyed into the Excel worksheet, the calculation/algorithms in the Excel sheet, produces an additional data element separate from the "raw data elements", but saved alongside those raw data elements.*
    - *For the loan inventory records, a Teraverde staff will receive on at least a weekly basis new loan inventory records and delete the old records and replace with new loan records.*
- *A single updated flat file is currently required to ensure that the Qilk application has the specific data elements to run its business intelligence and visualizations. For instance, for the data element of "Product Type" there are 5 products. The Product Type data element must be standardized so that Qlik can properly display a pie chart, bar chart, etc.*
- *After the flat file is updated (either for an update to the loan tape or an update to an adjustment file), then it is saved within a network folder. Next, the Qlik application must be reloaded and refreshed to utilize the newly updated data file.*

2.2 Proposed Business Process (To-Be)

The diagram below displays a general overview of the Proposed Business Process to establish the SQL Database environment containing the TV Standardized Loan Inventory.



2.2.1 Create unified SQL database to maintain loan inventory records

- Establish Standardized TV Loan Inventory
  - **Overview:** Seller Loan Tapes contain common data elements. However, the format and layout is unique to each seller. Therefore, the Seller Loan Tapes must be mapped, compiled, and consolidated into a TV Standardized Loan Inventory Table in the SQL database.
  - **Best Case Solution:** Provide a tool to map and import Seller Loan Tapes into SQL database into the TV standardized loan table format.
  - **Minimal Acceptable Solution:** Manually map Seller Loan Tapes into the Standardized TV Loan Tape format prior to import into SQL.

- Market Price Calculation Configuration
  - **Overview:** Market Price Table is utilized for Lookup/Calculations for the following TV Standardized Loan Table Column Headers: MBS Coupon, Buyup / Buydown Adjuster, and LTV/FICO Adjuster. Market Price Table is to be updated on a periodic basis, ideally in real time through-out the day or on a specified schedule.
  - **Best Case Solution:** MBS Live or live pricing from another provider is received from an automated feed on a specified schedule. Then, Input Values and the related calculations in the Pricing Table as noted above are automatically updated in SQL.
  - **Minimal Acceptable Solution:** Pricing Table is maintained in Excel, updated manually on a specified schedule, and saved to a network drive for auto-import into the SQL.
- Loan Level Pricing Adjustments (LLPA) Configuration
  - **Overview:** LLPA or Loan Level Pricing Adjustment Tables are static tables that require minimal updating. The Tables are used for the following Columns on the TV Loan Table: Hybrid ARM (conforming and jumbo), Jumbo FRM, Investment Property, Multi-unit Property, Condo w/ Term >15 Year, and Self Employed. All values are hard-coded.
  - **Best Case Solution:** Method/tool to auto-import changes/updates to the LLPA Tables into SQL.
  - **Minimal Acceptable Solution:** Since changes to the tables occur infrequently, manually updating the tables and saving the tables to a network location for auto-import into SQL.
- Geocoding Configuration - TBD
  - Overview:
  - Best Case Solution
  - Minimal Acceptable Solution
- SNL Data Configuration
  - **Overview:** SNL Financial is a provider of a variety of data related to the Financial Services Industry including Summary and Detailed market and financial data based on Regulatory Financial Filings (e.g. Bank Call Reports). The following three tables have been created based on the SNL Source Data: Loan Composition, Historical Yields (Last 5 Quarters), and a Yield Table (current quarter). The Tables require updating as follows: (1) Quarterly for Existing Client Banks; and (2) New Client on-boarding.
  - **Best Case Solution:** Develop automated process/tool to extract required data from SNL and import/load into SQL.
  - **Minimal Acceptable Solution:** The three tables are maintained in Excel; manually updated on Quarterly basis and/or New Client added at on-boarding; and saved to a specified network location for auto-import into SQL.

2.2.2 Enable Qlik Sense “write-back” functionality to the SQL Database

- Capture one or more data elements (e.g. buyer and seller preferences or selection criteria) at a single time or at multiple times initiated by one or multiple users.
- Ensure that the aforementioned one or more data elements can be “written-back” appropriately to and retained by the SQL database.

2.2.3 Ensure SQL can accept the updates for "write-back" functionality from Qlik Sense.

- Update SQL database with one or more data elements captured by the Qlik Sense "write-back" functionality referenced in Section 2.2.2 above.
- Ensure that the SQL database can effectively accommodate updates occurring for multiple data elements at multiple times by multiple users.

2.2.4 Ensure SQL can maintain loan inventory transaction histories.

- Ensure SQL can maintain loan level transaction histories
- Ensure SQL can accommodate updates to the loan inventory for new loans while retaining loans flagged as 'committed'.

2.2.5 SQL Database Update/Refresh Schedule

- Once every night, the SQL data tables are automatically overwritten with the most up-to-date Seller Tape and adjustment data.
- Adjustment calculations are performed, adding calculated data elements to the loan data SQL table on a loan by loan basis.
- All Qlik applications are automatically republished.

2.2.6 Create Reporting to monitor SQL database activity

- Data load validation/exception report is generated to capture missing or invalid data and received by the database administrator to perform required remediation.
- Audit Trail reporting is generated to capture an activity log and or data load time stamps and received by database administrator to ensure nightly processing occurred.

3 Business Requirements

The requirements in this document are prioritized as follows:

Value	Rating	Description
1	Critical	This requirement is critical to the success of the project. The project will not be possible without this requirement.
2	High	This requirement is high priority, but the project can be implemented at a bare minimum without this requirement.
3	Medium	This requirement is somewhat important, as it provides some value but the project can proceed without it.
4	Low	This is a low priority requirement, or a “nice to have” feature, if time and cost allow it.
5	Future	This requirement is out of scope for this project, and has been included here for a possible future release.

3.1 Functional Requirements

3.1.1 Establish Standardized TV Loan Inventory

- As previously stated, Seller Loan Tapes contain common data elements but are typically in a unique format.
- Each Seller Loan Tape must be configured/mapped to match the standardized TV Loan Tape and then loaded into the SQL Database.
- There are three types of data mapping and translation that must be configured:
    - **Header Mapping**: Seller Loan Tape Headers must be configured to match the TV Loan Tape Headers. This is a straight forward raw data mapping exercise. For example, the Provident Loan Tape contains a header titled AppNum (or Loan Number) which maps to the header titled Source Loan Number on the TV Standardized Loan Tape.
    - **Data Translation**: A data element may require translation into a TV defined format either via a lookup table or directly by a formula. For example, the Provident Loan Tape includes the Program Name and is used to configure 5 other loan tape headers/values (Product Type, Conforming and Jumbo, Amortization, Term and Loan Type). The following illustration depicts the translation.

Program Name	Product Type	Conforming and Jumbo	Amortization	Term	Loan Type
Conf 10	15 FRM	Conforming	Fixed	120	Conventional
Conf 15	15 FRM	Conforming	Fixed	180	Conventional
Conf 15 Fixed Relief	15 FRM	Conforming	Fixed	180	Conventional
Conf 20	30 FRM	Conforming	Fixed	240	Conventional
Conf 20 Fixed Relief	30 FRM	Conforming	Fixed	240	Conventional
Conf 25 Yr	30 FRM	Conforming	Fixed	300	Conventional
Conf 30	30 FRM	Conforming	Fixed	360	Conventional
Conf 30 Fixed Relief	30 FRM	Conforming	Fixed	360	Conventional
Conf 5/1 LIBOR (2/2/5)	5/1 ARM	Conforming	ARM		Conventional
Conf 7/1 LIBOR (5/2/5)	7/1 ARM	Conforming	ARM		Conventional
FHA 15 Yr	15 FRM	Conforming	ARM	180	Government
FHA 15 Yr Streamline	15 FRM	Conforming	Fixed	180	Government
FHA 30 Yr	30 FRM	Conforming	Fixed	360	Government
FHA 30 Yr Streamline	30 FRM	Conforming	Fixed	360	Government
Jumbo 15 Year	15 FRM	Jumbo	Fixed	180	Jumbo
Jumbo 30 Year	30 FRM	Jumbo	Fixed	360	Jumbo
Jumbo 5/1 LIBOR (2/2/5)	5/1 ARM	Jumbo	ARM		Jumbo
Jumbo 7/1 LIBOR (2/2/5)	7/1 ARM	Jumbo	ARM		Jumbo
Relief Conf 5/1 Libor (2/2/5)	5/1 ARM	Conforming	ARM		Conventional
SC 5/1 (2/2/5)	5/1 ARM	Conforming	ARM		Conventional
Super/Conf 15	15 FRM	Conforming	Fixed	180	Conventional
Super/Conf 30	30 FRM	Conforming	Fixed	360	Conventional
Super/Conf 30 Relief	30 FRM	Conforming	Fixed	360	Conventional
(blank)					

- **Establish missing data elements**: If the Seller Tape does not map and/or include a translation to populate a header or data element on the TV Standardized Loan Table, then an assumption must be applied to establish the missing data element.
- After being configured into the TV Standardized Loan Table format, the Seller Loan Tape is loaded into the SQL database.

3.1.2 Market Price Calculation Configuration

- Market Price Table contains the data elements utilized for loan pricing within Sprinkle.
- The table must be updated on a periodic basis, ideally in real-time throughout the day or on a defined schedule to update the following data points with the SQL database: MBS Coupon, Base Price, and Buyup/ Buydown Adjuster.
- Pricing data is obtained from 3 Sources: MBS Live (https://app.mbslive.net/), Mortgage News Daily (http://www.mortgagenewsdaily.com/mortgage_rates/), and the Sandler Yield Curve Opportunities Packet (monthly email).
- The table contains Input Values obtained from the aforementioned sources that need to be updated or refreshed, hardcoded values, and calculations that update based on changes to the Input Values. See SprinkleX_SQL Dev Workbook for further details.
  - **MBS Live Input Values**: MBS Live is a provider of real-time pricing data. The following base price values are updated from MBS Live based on the table below.

MBS Live Fannie Mae 30 Year/Price	Market Price Table
FNMA 3.0	30 FRM3
FNMA 3.5	30 FRM3.5
FNMA 4.0	30 FRM4
Fannie Mae 15 Year/Price	**Market Price Table**
FNMA-15 2.5	15 FRM2.5
FNMA-15 3.0	15 FRM3
FNMA-15 3.5	15 FRM3.5
Treasuries/Yield	**Market Price Table**
5 YR	5/1 ARM0.5
7 YR	7/1 ARM0.5
10 YR	10/1 ARM0.5

- **Mortgage News Daily Input Values**: The following price values are updated from Mortgage News Daily Secondary Markets Table based on the following table.

Mortgage News Daily Secondary Mortgage Markets	Market Price Table
30YR FNMA 4.5	30 FRM4.5
30YR FNMA 5.0	30 FRM5

- **Sandler Yield Curve Opportunities Packet**: Less frequent updated due to timing of receipt of monthly email. This input value is listed as the Spread to Treasury value for the following table items: 5/1 ARM0.5, 7/1 ARM0.5, and 10/1 ARM0.5.

- After the Pricing Table has been updated, pricing elements listed at the beginning of this section within the SQL database are automatically updated.
  - **MBS Coupon:** (Interest Rate - Base Guarantee Fee - Servicing Rate) rounded to the nearest multiple of 0.5) Examples: If Interest Rate - Base Guarantee Fee - Servicing Fee = 2.800, then MBS Coupon = 3.000. If = 3.050, then 3.000.
  - **Base Price:** Concatenate (Product Type&MBS Coupon), then lookup against Market Price Table to return Base Price
  - **Buyup/ Buy Down Adjuster:**
    - (A) Calculation for Fixed Rate Mortgages (FRM): MBS Coupon - (Interest rate - Base Guarantee Fee - Servicing Rate)
    - (B) Calculation for Adjustable Rate Mortgages (ARM): ((Interest Rate - Base Guarantee Fee - Servicing Fee) - Par Rate) * Buyup/Buydown Multiple
    - (C) Calculation for Buyup/Buydown Adjuster: Select (A) OR (B) based on Product Type * Buyup/Buydown Multiple

3.1.3 Loan Level Pricing Adjustments (LLPA) Configuration

- LLPA or Loan Level Pricing Adjustment Tables are static tables based on the standard Fannie Mae loan level pricing adjustment tables and require minimal updating.

- The tables listed within the SprinkleX_SQL Dev Workbook will be loaded into the SQL database.
- The tables should be updated directly within SQL or via an import from a manually maintained Excel file saved in a specified network folder.
- The tables are utilized to populate the following data elements within TV Standardized Loan Inventory residing in the SQL Database.
    - **LTV/FICO Adjuster:** Use each loan's FICO and LTV to compare against LLPA Table 1: LLPA by FICO / LTV Ratio to return the applicable LLPA.
    - **Hybrid ARM (conforming and jumbo):** If Amort Type is "ARM", then use Table 2: LLPA by Product Feature to lookup LLPA based on LTV.
    - **Jumbo FRM:** If Loan Type is "JUMBO", then use Table 2: LLPA by Product Feature to lookup LLPA based on LTV.
    - Investment Property: If on the Loan Table Occupancy = Investment, then use Table 2: LLPA by Product Feature to identify applicable LLPA based on the LTV.
    - **Multi-unit Property:** Use "Units" to determine LLPA from Table 2: LLPA by Product Feature. For example, if the Units are “2” and the LTV = 80%, then LLPA = -1.000.
    - **Condo w/ Term > 15 Year:** If Property Type is "Condominium" and the Loan Term > 15 years, then use Table 2: LLPA by Product Feature to determine LLPA based on LTV.
    - **Self-Employed:** If on the Loan Table Self-Employed = “Yes”, then use Table 2: LLPA by Product Feature to identify applicable LLPA based on the LTV.
- Final Price Calculation:

  Base Price
  + Buyup/ Buy Down Adjuster
  + LTV/FICO Adjuster
  + Hybrid ARM (conforming and jumbo)
  + Jumbo FRM
  + Investment Property
  + Multi-unit Property
  + Condo w/ Term > 15 Year
  + Self-Employed
  = Final Price

3.1.4 Geocoding Configuration

TBD - Keep in Qlik or configure in the SQL Database?

3.1.5 SNL Data Configuration

- SNL is a provider of various financial services industry related data for banks, bank holding companies, credit unions, savings and loan institutions as reported on Regulatory Financials (e.g. Bank Call Reports).
- Data is extracted from SNL Financial and loaded into the SQL database to be utilized in SprinkleX to prepare pro-forma visualizations for client banks utilizing SprinkleX.
- Three SNL Data Tables are established based on the following specifications and maintained in the SQL database
    - **Loan Composition Table**: Client Bank Loan Portfolio Concentrations for last reported quarter.

- **Source**: SNL Financial\Regulatory Financial Highlights\Loan Composition (%)
- Preparing the table (current process)
  1. Logon to SNL Financial (https://www.snl.com)
  2. Search for Client Bank (best case solution will be to develop SNL Report Export file to extract data)
  3. From Selection Menu expand option for Financials and Valuation
  4. Select Regulatory Financials Summary
  5. Select Regulatory Financial Highlights
  6. Navigate to Balance Sheet Highlights
     a. Under the Most Recent Quarter capture the Total Loans & Leases (Incl HFS) $ Amount.
     b. This amount is the basis for Calculating the "Dollar of Loans" for each of the loan categories.
  7. Navigate to Loan Composition (%)
     a. Under the Most Recent Quarter capture the % for the following loan categories: Total Real Estate Loans/Loans; CON: Total C&I Loans/Loans; Consumer Loans/Loans; CON: Agricultural Prod/Loans; CON: Oth Non-RE Lns/Loans; and CON: Total Leases/Loans.
     b. Update the Loan Composition Table with the Loan Composition % from #7a or add New Client Bank data to the table.
  8. Calculate the "Dollar of Loans" for each loan category
     a. Dollar of Loans = % of Loans (each category) * Total Loans & Leases (Incl HFS) as captured in #6a.
     b. Update the Table with the "Dollar of Loans" amounts for each loan category.
  9. Update the "Last Quarter" to reflect the most recent quarter in the following format: Q2 2016.

- **Historical Yields Table:** Client Bank Yields on Total Loans and Real Estate Loans for the last 5 quarters.
  - **Source:** SNL Financial\Regulatory Financial Highlights\Yields/Cost Analysis (%)
  - Preparing the table (current process)
    1. Logon to SNL Financial (https://www.snl.com)
    2. Search for Client Bank (best case solution will be to develop SNL Report Export file to extract data)
    3. From Selection Menu expand option for Financials and Valuation
    4. Select Regulatory Financials Summary
    5. Select Regulatory Financial Highlights
    6. Navigate to Yields/Cost Analysis (%) Section
    7. Pull Yield Values for "Yield on Loans and Leases" and "Yield on RE Loans" for the last 5 quarters
    8. Update the table accordingly
- **Yield Table:** Client Bank Yield and Interest Income on Total Loans and Real Estate Loans for the last report quarter.
  - **Source:** SNL Financial\Regulatory Financial Highlights

- **Data Elements**
  - Total Loans and Leases: Most Recent Quarter is pulled from Balance Sheet Highlights as documented in #6 of preparing the Loan Composition Table.
  - Yield on Total Loans: Most Recent Quarter is pulled from the Yields/Cost Analysis (%) Section as documented in #7 of preparing the Historical Yields Table.
  - Yield on Real Estate Loans: Most Recent Quarter is pulled from the Yields/Cost Analysis (%) Section as documented in #7 of preparing the Historical Yields Table.
- **Calculated Elements**
  1. Average Total Loans and Leases: Calculate the Average Total Loans and Leases for the Last 2 Quarters (e.g. From the Balance Sheet Highlights, pull the Total Loans and Leases for Q1 and Q2 and calculate the average).
  2. Interest Income on Total Loans: Calculate the Interest Income earned on Total Loans. Multiply the Avg. Total Loans and Leases by the Yield on Total Loans. Formula: Avg. Total Loans and Leases/1000 (converts to thousands) * Yield on Total Loans/100/4 (converts annualized yield to quarterly yield).
  3. Interest Income on Real Estate Loans
     a. Calculate the Avg. Real Estate Loans for the last 2 quarters
        i. Calculate Real Estate Loans for Last 2 Quarters (Multiply Total Loans and Leases by Loan Composition % for Real Estate Loans)
        ii. Average the results for the Last 2 Quarters calculated in 3ai.
     b. Multiply the Avg. Real Estate Loans by the Yield on Real Estate Loans. Formula: (1Avg Real Estate Loans/1000) * (2Yield on Real Estate Loans/100/4)

3.1.6 Database Refresh/Load Schedule

- Establish automated process or schedule to process updates/data load to SQL database.

3.1.7 Reporting

- Reports as outlined in Section 3.2.1 are generated based on Refresh/Load Schedule and provided to the SQL Database Administrator for review.

See “Functional Requirements” spreadsheet.

See “SprinkleX_SQL Dev Workbook” spreadsheet.

3.2 Non-Functional Requirements

ID	Requirement
NFR-001	The SQL database shall accommodate up to 100 users concurrently.
NFR-002	The SQL database shall be secure and it contains loan information.
NFR-003	The SQL database shall be updated timely as data elements are received and/or changed.
